missing data pose challenges to real life data analysis simple ad hoc fixes like deletion or mean imputation only work under highly restrictive conditions which are often not met in practice multiple imputation replaces each missing value by multiple plausible values the variability between these replacements reflects our ignorance of the true but missing value each of the completed data set is then analyzed by standard methods and the results are pooled to obtain unbiased estimates with correct confidence intervals multiple imputation is a general approach that also inspires novel solutions to old problems by reformulating the task at hand as a missing data problem this is the second edition of a popular book on multiple imputation focused on explaining the application of methods through detailed worked examples using the mice package as developed by the author this new edition incorporates the recent developments in this fast moving field this class tested book avoids mathematical and technical details as much as possible formulas are accompanied by verbal statements that explain the formula in accessible terms the book sharpens the reader s intuition on how to think about missing data and provides all the tools needed to execute a well grounded quantitative analysis in the presence of missing data

the analysis of variance is presented as an exploratory component of data analysis while retaining the customary least squares fitting methods balanced data layouts are used to reveal key ideas and techniques for exploration the approach emphasizes both the individual observations and the separate parts that the analysis produces most chapters include exercises and the appendices give selected percentage points of the gaussian t f chi squared and studentized range distributions

the most complete current guide to the signal processing techniques essential to advanced radar systems fully updated and expanded fundamentals of radar signal processing second edition offers comprehensive coverage of the basic digital signal processing techniques and technologies on which virtually all modern radar systems rely including target and interference models matched filtering waveform design doppler processing threshold detection and measurement accuracy the methods and interpretations of linear systems filtering sampling and fourier analysis are used throughout to provide a unified tutorial approach end of chapter
